LEADCLAD

REG. U. S. PAT. OFFICE 1923

THE LEADCLAD WIRE COMPANY
MOUNDSVILLE, WEST VIRGINIA

Foreword

THE surest way to buy less fence is to buy the best fence in the first place. To get the longest wear at the lowest cost per year of service, buy LEADCLAD, the only fencing made with a thick heavy coating of PURE LEAD. The life of any fence or roof depends on resistance of the coating to rust. About the longest lasting metal we know of is LEAD. You pay for good fence whether you get it or not. In these days when the farmer must watch every penny carefully, it is bad business to buy cheap fence. Buy less Fence by buying longer lasting fence—BUY LEADCLAD.

Leadclad Fence
Style - 726-6

Figure How to Make Your Farm Pay the Greatest Returns . . .

THE FARMER with an eye to greater profits rotates his crops, diversifies them and his stock in practical accordance with the location of his farm, the type of soil and various other factors. To secure the utmost from your farm you should follow these modern methods. Take samples of your soil to the County Agent and have him test it and make suggestions as to what elements are needed to increase fertility. If this is impractical, send it to the State Agricultural College. You may find that the planting of legumes in your wheat field will increase yield tremendously as well as furnish a wonderful feed for stock. Wherever possible let live stock feed on your stubble fields. Don't waste the corn the pickers miss, let it fatten the hogs by having them salvage it. Consider, too, the advisability of muskrat farming if you have any marshy, unprofitable land on your farm. Many farmers have found in muskrats a source of tremendous profit from land that before had produced nothing and cost a lot in taxes.

On any properly diversified farm, good fence is tremendously important. Good fence protects growing crops, turns stock and saves many needless losses of both. On a North Dakota farm, it added nine times its cost to the production value of the land *in one year*. In another case in Illinois, 14 times its cost. These are actual figures. LEADCLAD farm fence, barb wire and notch-back posts are the best that money can buy. They will cost you far less per year of service than any cheap fence you buy. LEADCLAD not only costs less in the long run but saves you all the bother and trouble of putting up several fences. LEADCLAD is a *paying investment*. In this book we tell you why the thick heavy coating of PURE LEAD will save you many, many dollars of upkeep cost and will add to your profits.

Start Re-fencing now with Leadclad and Save Future Expense and Worry

The Importance of Good Fences

THE LOWEST price fence you can buy on the basis of cost per year of service is LEADCLAD. You can buy cheaper fences but in that case you'll buy a whole lot more, for they don't last. Poor fence rusts quickly, permits stock to break through into growing crops or onto the highway where passing cars may kill them. LEADCLAD fence will protect your crops and stock long after a couple of cheap fences have rusted through. *Buy less fence—buy longer lasting fence—buy LEADCLAD.*

What LEADCLAD Is . . .

THE MANUFACTURERS of LEADCLAD wire had for many years fully realized the great money loss suffered by farmers who put up short-lived fences, roofs and sheet metal work. They therefore, persistently carried on research and experiments with a view to finding a method of applying a heavier, more rust-resistant coating on fence wire and sheet metal products.

Obviously, the first aim was to obtain a better anchorage, or a better adhesion, for the coating, so that the thickness could be increased to the desired extent without danger of having it peel off, either in weaving the wire into fence, or afterwards when put into service.

As these experiments progressed, it became increasingly clear to us that while zinc had been a perfectly satisfactory material when applied on the old-fashioned wrought iron, it was but poorly suited for the modern metal, steel. Obviously, a tougher, more pliable, and more strongly adhesive coating material was required.

We then began to experiment with other coating materials and finally succeeded in developing processes whereby pure lead could be applied in a heavy coating which would adhere firmly and resist corrosion a great many times longer than the best galvanized coating ever applied on steel products. This, then, was the origin of LEADCLAD—a secret process known only to the manufacturers of LEADCLAD Wire and Roofing products. In the manufacture of LEADCLAD Wire, the size of the wire is used for its strength only—the thick, pliable, PURE LEAD coating for its long life.

The LEADCLAD Non-Slip Knot

THE LEADCLAD non-slip knot shows why LEAD-CLAD fences can be climbed by hunters without slipping or spreading the wires. Both stay and line wire are kinked to form a non-slip knot when bound together. Note also, how the knot is left open to permit the evaporation of any moisture that might cause corrosion.

In the event of any strain, such as rooting from underneath by hogs, or bearing down from above by horses or cattle, this is distributed to each of the many line wires, making a stiffer fence; one with a come back which the fence with a cut or wrapped stay doesn't have.

How LEADCLAD is Made

LEADCLAD wire is unique in that *it is the only fence wire made that is covered with PURE LEAD*. It is inevitable that there should be imitators, and that other manufacturers should make claims that lead is used in making their wire, but there never has been and never will be but one LEADCLAD—the *genuine*.

The base of LEADCLAD Farm Fence is an unusually strong, tough, full gauge wire, from which the sulphur and phosphorous have been almost entirely worked out. Too much sulphur makes wire brittle when hot, and too much phosphorous makes it brittle when cold.

How LEADCLAD Is Made--Cont.

After the wire is drawn through the dies which gauge it accurately, it is drawn slowly through a bath of *red hot lead*. This operation is for the purpose of *toughening* and *strengthening* the wire only. All good galvanized wire receives this treatment.

It next passes through a chemical bath which thoroughly *cleanses the surface* of the wire.

The wire then passes into two more baths which prepared the cleansed surface to receive the PURE LEAD coating.

The wire then enters the PURE LEAD, which is maintained, by delicate instruments, at a temperature of 755 degrees Fahrenheit. This process is necessarily a slow one, as the *lead coating* operation must be thoroughly done.

Nothing but the highest grade Missouri lead is used in this coating process.

The wire moves very slowly through this process, and the coating applied is a *thick, heavy jacket of PURE LEAD, seven times heavier than the coating of zinc or galvanizing on ordinary fences.*

After leaving this process the wire passes through one more process, which coats the wire with a thin film of oil to lubricate it during the process of weaving it into farm fence and barbed wire.

The greatest care is taken with LEADCLAD wire to obtain an even, thick coating, which insures it the long wearing qualities for which LEADCLAD fences are noted. The process of making LEADCLAD wire could be cheapened by hastening the operations, but the reputation of LEADCLAD for long life and long wear rests upon the thorough care with which it is made, and the users of LEADCLAD may rest assured that its high quality will never be sacrificed for speed.

MAGNIFIED view of galvanized and LEADCLAD wires, showing tendency of all galvanizing to peel or flake off, especially if it is put on heavily. A heavy galvanized coating is worse than a light one. This LEADCLAD wire has a coating seven times heavier than ordinary galvanized wire, but as the lead is tough and pliable, it sticks to the wire like glue. You may whittle part of it off with a sharp knife, but you can't get it all off, for it is fused to the copper-steel base.

What is Rust Costing YOU?

MORNING, noon and night, every day in the year, including Sundays and Holidays, rust keeps pecking away at your fence. Each year it actually eats up and destroys as much ordinary wire fencing as all the galvanized wire mills produce in the same time. You know these little rust devils take their toil everywhere but are always at their worst in the soft coal and manufacturing centers. Coal smoke, acid fumes, moisture and the sultry salt sea air makes a most favorable atmospheric condition for rust to do its worst. It is to cure or lessen this costly ravage by rust that LEADCLAD Fence is made. The heavy lead jacket keeps the rust devils away, makes your fence last a lot longer, and saves you a lot of money.

Leadcoating Seven Times Heavier

THE LIFE of a fence, as already stated, depends almost wholly on the coating. Measured by weight, the LEADCLAD coat is over seven times heavier than the galvanizing on commercial fence wire. Spread 30 lbs. of zinc over 2,000 lbs. of steel wire and it gets pretty thin—thinner than fine tissue paper—too thin to be measured. That is the kind of wire you have been buying in the past. But spread 200 lbs. of pure lead over the same surface and you have a real coating, seven times heavier, affording a genuine protection against the elements and rough usage. That is LEADCLAD.

Add to this the fact that the LEADCLAD coating is very tough, pliable and firmly adhering; that it can be bent, twisted, pounded and abused to an almost unbelievable degree; and that it won't show any tendency to flake or peel off. It is easy to see why such a coating must outlast any galvanized coating many times over.

The Test of Actual Service

FROM every part of the country where LEADCLAD has been in use for many years, we are receiving letters expressing the utmost satisfaction with its service. Many letters come from farmers who bought LEADCLAD nine or ten years ago, for use in localities and under conditions very destructive to all metal products. LEADCLAD fences, in all of these cases, are reported to show no signs of rust, while galvanized fences have been completely destroyed in the same length of time. (See reproductions of letters on pages 11 and 69.)

Needless to say, all of these farmers found they are making substantial savings in cost of fencing, and it is a safe bet they will buy nothing but LEADCLAD in the future. They naturally also want LEADCLAD roofing, LEADCLAD shingles and sheet metal work for their homes, barns, and buildings of all kinds. For LEADCLAD is the solution of one of the most serious problems on the farm—destruction by rust.

From large mining companies, railroads and industrial plants, comes the same kind of testimony as to the durability of LEADCLAD, and their purchases are very big. A few of the many letters received from such concerns are reproduced on page 69.

Agricultural Colleges and Experiment stations are also showing great interest in LEADCLAD, and in the last few years have put up a number of fences with samples of different kinds of wire, including LEADCLAD, for test purposes. In these tests, LEADCLAD so far has shown no signs of rust and with every passing year, its superiority over other wire fences becomes more and more convincing. If you visit any institution of this kind, be sure to see if they have a LEADCLAD and other wire fences put out for tests. The comparison will be very interesting.

Out in the open meadow back of the LEADCLAD plant, where factory smoke, river fog, hail, frost, rain, sleet, and sun can reach it with full effect, is the LEADCLAD Testing Ground. Here fence of every brand was put up years ago, along with LEADCLAD. Frequent inspections have shown all LEADCLAD wire to be in perfect condition, while all the other wire is found in various stages of deterioration from rust.

Here visitors from near and far are welcome. An inspection of these fences will prove more enlightening than anything we can tell you in this book. A few photographs from these testing grounds are reproduced herein, to show typical difference between galvanized and LEADCLAD wire. See top page 27.

After 5 Years Service

LEADCLAD LASTS

The three pieces of wire, (A), (B) and (C) were cut from the fence shown in the photograph. (B) and (C) were cut from the two strands of galvanized barbed wire strung five years ago on these posts. (A) was cut from one of the two strands of LEADCLAD barbed wire erected at the same time on the same posts. The two strands of galvanized wire are practically destroyed, while the LEADCLAD erected at same time, on the same posts, shows no sign of rust.

A—Leadclad

B—Galvanized

C—Galvanized

TESTIMONIALS

What LEADCLAD Users Say:

Leadclad Wire Company
Moundsville, W. Va.
Gentlemen:

July 8, 1929

Two years ago I began to purchase Leadclad wire. I put it up side by side with galvanized. The galvanized is rusted badly, while Leadclad shows no sign of rust.

The fencing problem is solved on the farm. You could not interest me in any other fence. I consider your Style 0726 the ideal hog fence.

Yours truly,
J. B. West, Supt.

Leadclad Wire Co.
Moundsville, W. Va.
Dear Sirs:

In 1924 we were induced to try some Leadclad wire and we put up three rolls.

This year we were not able to get any, and had bought ten rolls of the galvanized, put out by.....Co. before I saw the ad and wrote for your catalog.

About 5 to 6 years is the best we get out of galvanized wire here.

The Leadclad wire looks as good as it did the day we put it up. And I think I will be safe in saying that from now on we will use the Leadclad wire.

Yours truly,
Willard Storcker, Box 423,
Crooksville, Ohio.

Leadclad Wire Company,
Moundsville, W. Va.
Gentlemen:

December 16, 1929.

"I bought your LEADCLAD fence 10 years ago, and erected it on my farm where ordinary fence only lasts a few months. This is a section where the coal smoke and acid fumes from the factories and mines, mixed with the moisture and fog from the Ohio River, quickly destroy all ordinary iron and steel products.

Your LEADCLAD fence is as good as new, and two installations of galvanized fence have rusted away, gone, and must be replaced. Send me

500 rods your Style H-939-12 LEADCLAD fence.

500 6½ ft. Notch Back LEADCLAD posts,
20 Spools 80 rod 4 Pt. Hog LEADCLAD Barb Wire.

ALL MATERIAL TO BE LEADCLAD.

Please include the handy twisting tool and the convenient staple and nail apron."

Yours truly,
(Signed) Barnett Beck.

Leadclad Wire Co.,
Moundsville, W. Va.

Gentlemen:

Six years ago I bought 20 rods of your Leadclad Poultry Fence to fence a lot in a locality of coal mines and near a large smelter plant, where fence never lasted over two or three years.

After six years the Leadclad Poultry Fence is apparently as good as the day I put it up. The heavy lead coat, if anything, has taken on a film or added coat, which I believe is natural for lead to do, and it adds as a further protection.

I. M. Berry.

GUARANTEE

All Glendale LEADCLAD wire products are guaranteed to have a coating of pure lead over seven times heavier (by weight) than the coating on corresponding gauges of commercial galvanized fence wire.

The coating on Glendale LEADCLAD wire is further guaranteed to be free from defects, and to adhere so firmly to the steel base that it may be twisted, bent, stapled to posts and submitted to all ordinary wear and tear, without peeling or flaking off.

We replace, free of charge, any wire which, upon receipt by purchaser, is not found to be exactly as represented.

LEADCLAD WIRE COMPANY
Moundsville, W. Va.

CAUTION!

Note: The above is the strongest guarantee ever made by a reputable manufacturer of wire fence. It virtually guarantees to the purchaser three to four times longer life than is obtainable from any kind of galvanized farm fence. Beware of fancy names given to ordinary galvanized fence. These terms mean absolutely nothing to you, for zinc is so brittle that it cracks and peels off unless it is put on very thin. A thin galvanized coating is therefore just as good, if not better, than a heavy one, for the former will at least stick to the metal.

Under average farm conditions, Glendale LEADCLAD wire will last many times the life of ordinary galvanized. It is not practical to guarantee the exact number of years, as conditions vary so much in different parts of the country, depending not only on the climate but on the proximity to railroads, factories, coal mines, etc. Corrosion is always more severe near such places. It would be impractical to attach guarantee tags to fences and be sure that they would stay in place outdoors for any number of years. If such a tag were knocked off or destroyed, as is likely to happen, the identity of the fence would be lost. Those who make such guarantees know perfectly well that this is just what happens in ninety-nine cases out of one hundred, and they are gambling on this fact when making guarantees of this kind.

LEADCLAD WIRE COMPANY
Moundsville, W. Va.

LEADCLAD Hog Fence

GOOD fences make good neighbors. LEADCLAD hog fences keep your hogs where they belong. Even the smallest runt will not be able to squeeze through them. And, of course, they have the lasting protection of a thick heavy coating of PURE LEAD. LEADCLAD hog fences are investments which pay big dividends. They outlast a couple of ordinary fences and are stout and neat looking. Several styles of LEADCLAD hog fence are shown on the following pages.

All Fences on this page have 7 wires--26 in. high--stays 12 in. apart

Style O-726-12

Here is a medium weight LEADCLAD hog fence. Keeps your hogs where they belong. The heavy jacket of PURE LEAD gives you extra weight, extra strength and longer life. See comparisons with ordinary fence on Pages 4, 10 and 27. Furnished in 20, 30 and 40 rod rolls. Stays are 12 inches apart.

TOP WIRE NO. 9

BOTTOM WIRE NO. 9

LINE AND
STAY WIRES NO. 9

This is an extra heavy weight LEADCLAD hog fence. All wires are No. 9. Often used around the barnyard, bull pen, or on fields where an extra heavy fence is necessary. Stays are 12 inches apart.

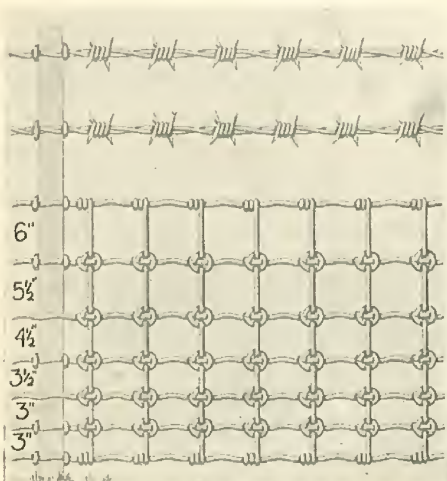

Furnished only in 20 and 30 rod rolls. The heavy protective coating of lead makes it impractical to ship rolls of larger size than 30 rods.

All Fences on this page have 7 wires—26 in. high—stays 6 in. apart

Style O-726-6

Here is a closely woven, rigid LEADCLAD hog fence of medium weight. Stays are only 6 inches apart and actual size of wires is shown in the circle above. The PURE LEAD coating, seven times heavier than the coating on galvanized, makes this fence outlast two or three ordinary ones. Furnished in 10, 20 and 30 rod rolls.

Style 1155-6-9
\$1.74 Rod

An extra heavy LEADCLAD fence. All wires No. 9. 6 inch stays. Recommended for heavy duty. Makes a fine lane or barnyard fence that will outlast any galvanized fence you can buy at any price.

Furnished in 10 and 15 rod rolls.

Small LEADCLAD wire lasts longer than big galvanized wire. LEADCLAD does not depend upon the thickness of the wire for its long life—it is its thick coating of pure lead that makes it last longer.

This galvanized (large wire) and LEADCLAD (small wire) was erected at the same time and place five years ago. Photograph actual size.

Leadclad Fence
Style 1155-12

Group of Young Heifers

Hampshire Down Sheep after Shearing

Flock of Hampshire Down Sheep in enclosure to keep them from over feeding

All Fences on this page have 6 wires—35 in. high—stays 12 in. apart

This medium weight fence is an economical one for sheep and larger animals. Spacing is too wide to turn pigs. A durable fence that will give you long service due to its PURE LEAD coating. Stays are 12 inches apart. Size of wires used shown in circle above. Furnished in 20, 30 and 40 rod rolls.

Style H-635-12
53c Rod

A heavy weight LEADCLAD fence. Used for larger animals. Not intended for pigs. Truly lasting due to the PURE LEAD coating. The top illustration on Page 28 will show you the trim appearance of this favorite LEADCLAD style. 12 inch stays.
Furnished in 20, 30 and 40 rod rolls.

LEADCLAD Crimp Wire

LEADCLAD crimped or spring wire used in many localities for fencing instead of barbed wire.

It stretches tightly yet allows plenty of expansion and contraction during the changes of season.

There are a lot of jobs around the house (both town and country) when you need a short convenient coil of soft pliable rust proof LEADCLAD smooth wire.

Clothes lines, radio aerials, lawn guard, and a hundred of other uses you will find for a handy coil of soft LEADCLAD smooth wire.

Vines rust out ordinary wire very quickly. In many sections, vineyards must be rewired every few years. LEADCLAD wire is not affected by dampness like galvanized wire. Its thick coating of pure lead resists moisture, frost and heat perfectly, making it the ideal wire for grape vines.

We pay the freight on 300 lbs. or more or on less quantity when ordered with other material.

LEADCLAD Heavy Barbed Wire

THIS is a heavy duty barb wire made from No. 12 wire with No. 12½ barbs. It is strong and sturdy and is recommended where extra heavy fence is needed such as around the barnyard or for road or lanes.

This barb wire has the same heavy coating of **PURE LEAD** as other **LEADCLAD** products. This coating is fused to the full strength copper bearing steel base by our own secret process. **LEADCLAD** will outlast ordinary barb wire by years and pays for itself many times in service rendered.

LEADCLAD Heavy Barb is spooled on catch weight spools approximately 100 lbs. to the spool. Comes in 2 or 4 point Barbs in Hog or Cattle style.

Price per hundred pounds \$6.75. We pay the freight on three spools or more.

LEADCLAD FENCE POSTS

LEADCLAD Notch Back

L EADCLAD notch back posts can be easily and quickly erected by one man through the use of the one man driver illustrated at the bottom of this page. The old way of placing steel posts was a big improvement over digging post holes, filling, tamping, etc. The LEADCLAD One-Man Driver is the latest and easiest method. The old way required two or more men and a truck or wagon. The new way requires only one man and a truck, part time. Frees the extra man and the truck for other productive work. Another time and labor saver. LEADCLAD notch back posts are reinforced with a heavy $\frac{5}{16}$ " rib the entire length of the post. They have smooth face and a notched back to grip the handy snap-on fasteners, furnished with each post. The anchor plate is riveted to post to give additional strength.

LEADCLAD Studded Tee Posts

The small illustration at right is the LEADCLAD Studded Tee Post, which we also supply. The stud keeps the line wire from slipping. The wire tie holds the line wire firmly in position.

This high-carbon studded post of T shape is the strongest possible construction. It has no holes or slots to weaken it, and no tongues to break off.

Studded Line Post

How to Stretch Fence

STRETCH your fence tight and make every fence dollar do its full duty with Double Jack wire fence stretcher.

A giant for strength and pulling power. All steel and malleable—never wears out—lasts a lifetime. Simple in construction, easy to operate. On or off the fence in two minutes. No bolts or loose clips to tighten—simply clamp two angles together.

Jacks are easy to operate—stop and hold at any point or release tension without danger to operate. No pawls or ratchets.

Double-Jack Stretcher

Each chain tested to more than 5000 pounds.

Quickly adjustable to fence of any height up to 60". Stretches any style, light or heavy—it never slips. Never injures the fencing.

Weight 100 lbs. Every set fully guaranteed.

A Complete Double Jack Fence Stretcher Includes

- 2 "Quick Clamp" Jacks.
- 2 Steel Angle Bars.
- 2 Twelve Foot Chains, Copper plated with Swivels and large End Rings.
- 1 Hand Stretcher, for taking up slack at end of fence, or stretching barbed wire.
- 1 Jack Handle.

Single Jack, complete..... 7.25

HOME OF LEADCLAD

NESTLED down among the farms on the banks of the beautiful Ohio, halfway between Glendale and Moundsville, flanked on one side by the gently sloping hills of Ohio and on the other by the more rugged "little mountains" of West Virginia is the home of LEADCLAD.

A great, busy, throbbing factory, covering many acres, operating right in the midst of a farming community, yet with all the transportation facilities and conveniences provided by modern railroad, motor, and waterway. The 1000-foot shipping platform is served by the main road of the B. & O., and a wharf is maintained upon the Ohio River. A fast electric railway express and a national motor truck thoroughfare also serve the home of LEADCLAD, at all times providing a speedy service for LEADCLAD users.

FENCE AND ROOFING

NOWHERE else in the world is there a pure lead-coated fence and roofing made. The men who own and operate the LEADCLAD factory are men who were born and raised on the farm; men who have slept in the old trundle bed, done chores by lantern light, and who would rather sit down to a stack of buckwheats any time, than at the banquet table of a Statler Hotel.

These men know thoroughly the problems of the farm.

They know how long it takes to put up a fence; they know how much sweat it takes to pay for a fence; they know what it is to have a barn burned by lightning.

They know the kind of a fence the farmer wants—they know the kind of a roof the farmer needs, and they are making it.

LEADCLAD *farm fence*

FARM, STOCK AND POULTRY GATES

Styles A and B Drive Gates

Style A is made with round corners at top and electrically welded square corners at bottom. The frame is 1½-inch steel tubing galvanized. The wire is genuine LEADCLAD No. 9 gauge square mesh with our famous non-slip knot. Closely spaced lateral wires at the bottom, with 6 inches between upright wires.

Style B is the same as above, with exception of the steel tube frame, which is not quite so heavy. A very stout, strong gate which will serve every practical purpose, at a slightly lower first cost.

STYLE "A" EXTRA HEAVY DRIVE GATE

STA-RITE SAGLESS FARM GATE

SAGLESS FARM GATES are made of Douglas Fir, and add wonderfully to the appearance of the premises where strong, rigid, light swinging gates are needed. They have beauty as well as strength for service. *They will not sag.*

There are no nails to pull out, no wood joints to gather moisture and decay. They have been thoroughly tested under all conditions of use and weather and they are guaranteed to give practical service for not less than five years.

The neatly spaced boards are **FIRMLY BOLTED** between **DOUBLE ANGLE STEEL** uprights, which gives the Gate ample strength where the most strain is applied. An extra *double brace* of angle steel extends diagonally across the body of the Gate and prevents Sagless gates from becoming bent and twisted out of shape. The **LONG TRUSS Hinge** at the top pulls directly from the middle upright at the top

of the diagonal steel brace and eliminates the strain on the rear upright at the point where most gates give out and sag.

The **BOARDS** are of smooth finish Douglas Fir practically free from pitch and knots and are well painted with good oil paint of rich orange color. The Gate Steels are painted with a high grade gloss black enamel. Each gate is fitted with a *stock proof eccentric*, and is complete with screw hooks ready to hang. We also furnish the steels, bolts and screw hooks, in sets complete, (everything except the boards) for making Sagless gates.

Sagless Gates are made only in one height—52 inches, with six boards to the gate (five inch top and bottom boards and four inch boards between) making the construction of this gate practical and neat in appearance. Standard lengths are 10, 12, 14 and 16 feet, but other lengths can be furnished.

Prices, Sta-Rite Sagless Farm Gates

Fittings for Steel Posts 75c Extra

GATE IRONS, \$3.00 A SET, BLACK ENAMEL FINISH

Four pair double angle steel uprights 52" high. Two angle steel brace irons 74" long. All irons are 1"x $\frac{3}{4}$ "x $\frac{1}{8}$ " thick, hinges, bolts and latch fastener included. The truss hinge for top is 64", bolts to center of gate and makes it impossible for gate to sag.

LEADCLAD Poultry Fence

Flock of Pure
Bred Light
Brahmas

LEADCLAD Poultry fence is made in square or woven fence and hexagonal netting. You will find a style and size to suit your requirements on the following pages. The coating is what determines the life of your poultry fence. LEAD, the most lasting of commercial metals, is used in coating LEADCLAD Poultry Fence, as in all other LEADCLAD products. This coating makes LEADCLAD outlast several ordinary fences. Remember that there is only one LEAD coated fence made, and that's LEADCLAD. Make your fence an investment instead of an expense by buying LEADCLAD.

Prize Winning Group of Buff Orpingtons

Style No. 1848-6

HERE is a poultry fence of extraordinary quality, made of full-sized, full-strength wire, heavily coated with pure, pliable lead, which makes it rust-proof. Strong enough to protect your gardens and closely spaced enough to fill every need of the poultryman. 18 wires—48 inches high—stays 6 inches apart.

For permanent fencing, there is no fence so economical as LEADCLAD. The LEADCLAD coating is seven times heavier than the coating on commercial galvanized fence, and it's the coating that prevents rust and makes fence last. LEADCLAD keeps rust away several times longer than galvanizing.

LEADCLAD Poultry fence is also made in 36 inch height. This style is 15 wires high and is known as Style 1536-6. See block to the right.

All LEADCLAD Poultry Fence made in 10, 20 and 30 rod rolls. No extra charge for 10 rod rolls.

Note!

LEADCLAD Poultry Fence is also made in 36 inch height by simply taking the top three wires off of the fence illustrated above. This gives a lead protected poultry fence of 15 wires, 6 inches between stays, 36 inches high. Order Style 1536-6.

74c a Rod

Style No. 2058-6

THIS medium height LEADCLAD Poultry Fence has 20 wires, is 58 inches high and has stays six inches apart. Keeps poultry in limits and protects your garden. This fence has a heavy coating of PURE LEAD to safeguard it from rust. Outlasts a couple of ordinary fences and saves you time, trouble, worry and expense.

For permanent fencing, there is no fence so economical as LEADCLAD. The LEADCLAD coating is seven times heavier than the coating on commercial galvanized fence, and it's the coating that prevents rust and makes fence last.

LEADCLAD Poultry Fence is also made in 72 inch height. This style is 23 wires high and is known as Style 2372-6. See block to the right.

LEADCLAD Poultry Gates to match LEADCLAD Poultry Fence on Page 38.

Note!

We make a higher fence—exactly the same as this—by adding three wires at the top, each five inches apart. This makes a 72-inch fence. This high fence is known as Style 2372-6.

\$1.12 a Rod

Flock of White Leghorns. Note the high fence with an 8 inch strip of 1 inch mesh at bottom. This keeps the chicks in while the high fence prevents this agile type of chicken from flying over.

**A flock of Rhode Island Reds. These birds do not fly so high and are bigger.
A wider mesh and lower fence is more practical than where
White Leghorns is being raised.**

This is an Actual Size photograph of LEADCLAD, 20 gauge 1 in. Mesh

WE ARE offering LEADCLAD Mesh Fencing to the public in response to the many urgent demands from our customers for this type of fencing with LEADCLAD protection.

LEADCLAD Farm Fencing, Barbed Wire and Fence Posts have been tried and proven by years of service under the most trying conditions and are firmly established in the public favor—especially that part of the public requiring fencing of long wear and low upkeep.

LEADCLAD Roofings for Homes and Barns have been made for nearly twenty years, and wherever roofs are used, they are accepted as giving the most protection against Fire, Lightning and the Weather.

LEADCLAD Mesh Fencing is of the same high quality, and carries the same thick, heavy PURE LEAD protection.

It is coated by the LEADCLAD process after weaving.

The coating of PURE LEAD is very heavy—the 16 gauge 1 inch mesh fencing 6 feet high has over *sixty pounds* of coating to the roll, and the other sizes in the same proportion.

LEADCLAD 20 gauge 1 inch mesh netting is furnished in 150 foot rolls in heights of 1, 2, 3, 4, 5 and 6 feet. 2 inch mesh is furnished in 2, 3, 4, 5 and 6 foot heights. 150 foot rolls. See page 47 for prices.

LEADCLAD Mesh Fences for Fur Bearing Animals

WHERE mesh fencing is used upon fur farms, it is frequently necessary to bury the fence in the ground, and this is destructive to most fences. But burying it in the ground has little effect upon LEAD. Bullets used in the Indian Wars, and in the Civil War, are being plowed up today, and their splendid condition is ample testimony to the wearing quality of PURE LEAD. The LEAD used upon LEADCLAD fencing is the same kind as the LEAD in a bullet.

Lead caskets were used for burying the dead a thousand years ago, and these caskets today are found to be in a good state of preservation.

There is no metal that will endure under the ground as well as LEAD.

LEADCLAD Mesh Fences for Fur Bearing Animals---Cont.

That is why LEADCLAD Mesh Fencing is so well adapted to the peculiarly severe service of Fur Farming requirements.

In LEADCLAD Poultry and Fur Farm Netting, the heavy jacket of PURE LEAD is applied after weaving, which seals thoroughly, gives great firmness and eliminates any crevice that might hold moisture and cause rust.

LEADCLAD netting is much heavier in actual weight than ordinary netting, all wires will gauge over size.

This is due to the heavy lead jacket that assures long life, eliminates replacement and upkeep expense.

LEADCLAD Netting is used for Poultry, Foxes, Muskrats and all Fur bearing animals, Game Preserves, Flying Cages, Dog Kennels, Tennis Courts, Window Guards, Flowers and Vine Trellis.

We especially recommend that LEADCLAD Fence Posts be used in connection with LEADCLAD Fencing, as the thick, dense coating of PURE LEAD makes them almost indestructible. See Post illustrated on Page 34.

LEADCLAD Lawn Fence

Beautifies • Protects • Lasts • Endures

WITH the rapid increase in the use of automobiles, it has become increasingly necessary to safeguard the lives of your children by enclosing the lawn with fence. Lawn fence used to be used as a decorative element and to keep out stray farm animals, chickens, cats and dogs. Today lawn fence is an absolute protective necessity for your children if you live near a paved highway or in suburban or city districts. You will find, too, that lawn fence will give you a very desirable sense of privacy as well as security from the property protection it affords.

LEADCLAD lawn fence is made particularly to meet your requirements. It is strong, sturdy and will beautify any home grounds. Made in two styles, it is furnished in rolls of any desired length and convenient heights. LEADCLAD lawn fence is above all things *lasting*. It is protected with a thick heavy coating of PURE LEAD, the most durable of metals. A LEADCLAD lawn fence will outlast two or three ordinary fences and combines beauty and utility with strong enduring protection.

Style S Lawn Fence

LEADCLAD Lawn Fence lasts many times longer than galvanized and it combines distinction with real protection.

LEADCLAD Lawn Fence is shipped in handy rolls, cut any length desired. It is light, easy to handle and can be speedily erected without any special tools or equipment.

Pickets are No. 9 LEADCLAD Wire spaced 3 inches apart at the top and $1\frac{3}{4}$ inches at the bottom. Cables are No. 12 gauge and spaced 6 inches. All wires are protected by a heavy coat of lead. Standard heights 30, 36, 42 and 48 inches.

LEADCLAD Fence Fittings

LEADCLAD fence fittings combine beauty with utility. They are designed to make installation easy and simple without sacrificing in the least the attractive appearance of the fence. All LEADCLAD fittings are protected with a thick heavy coating of PURE LEAD. This coating is seven times heavier than the coating ordinarily used and is your protection against destruction by rust. Be sure you get LEADCLAD Posts and Fittings with your LEADCLAD lawn fence.

Prices include two braces No. 10 Gauge, 2" O-D, 1 foot shorter than post, with one collar.

LEADCLAD Trellis

The Improved LEADCLAD A Lifetime Roof

FOR many years Glendale LEADCLAD roofing has been famous for its durability and beauty. Farmers everywhere have praised it highly and have shown their confidence by becoming buyers exclusively of LEADCLAD. Everyone knows that the life of a roof depends upon its coating. Its thick heavy coating of PURE LEAD, the most lasting of commercial metals, is responsible for the long life of LEADCLAD. This heavy coating is fused to a base of *copper bearing steel*. Glendale LEADCLAD has thus been doubly protected by a rust resisting core and a rustless coating. That's the reason why it has given such lasting and satisfactory service—two or three times that of ordinary galvanized roofing.

In 1930, in accordance with our policy of constant improvement, we have still further lengthened the life of Glendale LEADCLAD by increasing the thick PURE LEAD coating. LEADCLAD Products will now carry *one third more coating* than ever before. Here indeed, is a lifetime roof—one that is proof against lightning, fire, hail, frost and wind. All formed products such as shingles and fittings, tile, conductor pipe, gutter and other products, will be *coated after forming* by the *old fashioned hand dipping process*, each piece being dipped separately by hand in a vat of PURE LEAD. This is a double assurance that all edges and seams are sealed against the weather. To secure a lasting, storm-tight, weather-tight roof, use LEADCLAD, the prize roofing of 1930.

LEADCLAD is furnished in a complete line of roofing including roll roofing, standing seam, flat sheets, corrugated sheets, V-

crimps, shingles, Duplex tile, metal siding, valleys, gutters, flashings, spouting, eaves-trough and other sheet metal work. All these are illustrated and priced on the following pages.

Other Glendale Materials

The Glendale line of metal roofing also made in the following materials:

1. Hand Dipped Galvanized.
2. Apex Tight-coated Galvanized.
3. Prime Full Weight Roofing Tin.

An occasional coat of paint will give all "Glendale" products practically indefinite life, except under very severe conditions of smoke, salty atmosphere, and acid fumes. A number of homes in the vicinity of our plants were roofed with our shingles and sheet metal work, from 20 to 25 years ago, and all of these roofs

are still in good condition.

For barns and other farm buildings, Glendale corrugated, V-crimp, flat roll, or standing seam, in any standard gauge, are recommended.

For homes, churches, schools, mercantile buildings, garages and other similar structures, Glendale ornamental shingles and Duplex Tile furnish a superior protection. They are leakproof, fire and lightning proof, hail proof, sun proof, will not break, crack, curl up, rattle, or exhibit other weaknesses common to composition roofs, wood shingles, slate and earthen tile. They also present an exceptionally good appearance, especially when painted a suitable color.

The high standard of excellence of the "Glendale" line has made us by far the largest manufacturer of Metal Shingles in the world.

One Section of Our Roofing Department.

A View showing Spouting and Gutter Department.

These Glendale Metal Shingle Roofs Have Been in Service

22
Years

Above: Home of Mr. Frank Webb, Glendale, W. Va.

Right: Home of Mr. Charles Schane, Glendale, W. Va.

THE makers of Glendale shingles are the largest manufacturers of metal shingles in the world. In a metal shingle, the material from which it is made, as well as the design of the side lock and method of fastening, are most important factors.

The Glendale Side Lock provides a tight joint, which does not have to be soldered, yet leaves ample room for expansion and contraction under extremes of heat and cold.

In case of fire, the wood supporting structure has been known to burn from under and collapse, leaving the Glendale shingles suspended by their side locks from side to side of the unburnt sections, forming a perfect bridge over the burnt parts, as a check to further ravages of the flames.

The corrugations at the top, and the deep overlap at the bottom, make it impossible for driving rains or snow to get under these shingles.

All nailheads are protected from the weather.

Glendale shingles and tiles are easily laid, and complete instructions are furnished for the guidance of every purchaser. See illustration on page 60. They can be laid over old wood shingles or composition roofs.

Special Paint

Obtaining a really good paint for metal roofs is exceedingly difficult. For many years we experimented with hundreds of paints, all of which were claimed by their makers to be exactly what we wanted. But the results were always more or less disappointing. But we finally did succeed in obtaining a paint which is unexcelled in quality, and we are glad to supply this special roof paint, in red or green, to those who purchase our metal roofings. This paint will stick like glue, and shows no tendency to flake off or blister under hot sun, rain or frost.

Prices on Application

Note that the barn roof is grounded to make it absolutely
lightning proof.

Hand Dipped Glendal Metal Shingles

Salem
Slate

Plainfield
Slate

Eureka
Shingle

Standard
Shingle

Monarch
Shingle

FURNISHED in six styles as illustrated. The two plain designs "Salem" and "Plainfield" closely resemble slate when laid on the roof. The "Salem" has a higher butt end than the "Plainfield," adding to its slate-like appearance.

All LEADCLAD shingles are hand dipped, as stated on page 54, to insure long life. If left unpainted, they weather to a soft grey slate color. LEADCLAD costs a little more than the others, but as no painting is required, it really is the cheapest in the long run.

"Hand dipped" shingles are first tin coated, then hand dipped one at a time in a bath of molten zinc. This, too, is an exceptionally durable coating. If you desire to paint them, the first coat should not be applied until they have been on the roof for two or three months, otherwise the paint will not stick. Our Special shingle paint should be used. See Page 56.

Full instructions for laying furnished with each shipment. See also page 60.

LEADCLAD Hand Dipped Fittings for Glendale Shingles

GLENDALE shingle roof fittings are made in short lengths, with slip joints, so that no soldering is required. Short lengths are much preferable to long lengths, as they have less expansion and contraction, hence will not work loose or develop leaks so easily. Always use Glendale fittings for Glendale Shingles, as it will save you a lot of trouble and expense.

Full instructions for applying furnished with each shipment.

How to Lay LEADCLAD Decorative Shingles

The above illustration shows each operation in laying LEADCLAD Decorative Shingles.

A study of it should enable anyone to put on a shingle roof.

A chalkline, hammer and snips are all the tools needed.

Use care in running chalkline, be careful to nail at the right of small bead on right side of shingle, give full overlap at top and remember to break joints at every course.

LEADCLAD Siding

WEATHERBOARD SIDING

PRESSED BRICK SIDING

ROCK FACE STONE SIDING

ROCK FACE BRICK SIDING

The heavy lead coating on Leadclad Siding is practically indestructible, and needs no painting to protect it from rust. Saves its extra first cost many times over by saving of paint and labor, and gives much longer life in service. Leadclad 28 and 29 gauge will give longer life than tinplate or galvanized 26 and 27 gauge.

Net Prices per Sheet. We pay freight on 300 square feet or more.

Style	Gauge	Width Sheet	Length of Sheet in Feet							
			5'	6'	7'	8'	9'	10'	11'	12'

Hand Dipped LEADCLAD, Duplex Tile

Tile roofs have always been noted for their beauty, but the cost has been high. Now LEADCLAD Duplex tiles offer you all the good looks of earthen tile, plus protection against fire and lightning, greater strength and less breakage, hence longer life, at a cost within the reach of all.

Roof your home, school, filling station, or any other building for which the best looking roof is wanted, with LEADCLAD tile finished in red or green.

WRITE FOR PRICES ON LEADCLAD DUPLEX TILES AND FITTINGS

LEADCLAD Corrugated and Pressed Standing Seam Roofing

The sheets listed below are actually 26" wide so that, allowing 2" for overlap at sides, the sheet covers a width of exactly 2 feet. From 4 to 6 inches should be allowed for end overlaps, according to the pitch of the roof. The smaller the pitch, the greater the overlap needed. When used for siding, 2" overlap at ends is sufficient.

In using LEADCLAD sheets, you do not need the same heavy gauges as in galvanized sheets or tinplate. Owing to the heavy weight of the coating, 28 and 29 gauge LEADCLAD correspond to 26 and 27 gauge in other sheets, and will last much longer.

As LEADCLAD requires no painting to keep it from rusting, it is by far the cheapest roofing you can use. After two or three repainting, the cheapest roofing you can buy has actually cost you as much as LEADCLAD, and with the passing of time, LEADCLAD shows a bigger and bigger saving.

Don't forget to order LEADCLAD nails and lead washers. Be sure to use them with LEADCLAD roofing.

Prices per sheet. We pay the freight on 15 sheets or more.

Corrug. Sheets	Gauge	Lengths of Sheets in Feet								Weight per Sq.
		5'	6'	7'	8'	9'	10'	11'	12'

LEADCLAD Roofing Nails 15c per lb. (Allow one lb. per 100 Sq. Ft.)

LEAD Washers 25c per lb. (Allow ¼ lb. per 100 Sq. Feet.)

LEADCLAD Pressed Standing Seam

This form of LEADCLAD Roofing is furnished in conveniently sized sheets instead of rolls and saves you the trouble of making the seams yourself. It is attached to solid sheathing or lath by means of cleats. About one pound of cleats required to lay one square. Price, 10c per lb. No nails exposed. Applied by the use of squeezing tongs only. Prices per sheet:

LEADCLAD PRESSED STANDING SEAM

Gauge	5-Ft.	6-Ft.	7-Ft.	8-Ft.	9-Ft.	10-Ft.	11-Ft.	12-Ft.	Weight

LEADCLAD V-Crimp Roofing

2 V-Crimp

3 V-Crimp

5 V-Crimp

The "Width Covered" in table below indicates width which each sheet will lay to the weather after allowing for side overlap. Five-crimp sheets are recommended for best protection against leakage, as with two crimps overlapping at each side there is no chance for leaks at the lower end which are sometimes caused during heavy rains by siphoning or flooding over the lower part of a big roof when only one single crimp overlap is used.

In ordering, allow from 4 to 6 inches for overlaps at top and bottom of sheets.

This roofing requires no soldering, hammering or folding at joints or overlaps, and it can be laid by any fair mechanic.

Due to the heavy coating, 28 and 29 gauge LEADCLAD will serve the same purpose as 26 and 27 gauge galvanized, and last much longer.

LEADCLAD needs no paint to keep it from rusting, and therefore soon saves its extra first cost, and in the end is much cheaper than ordinary tinplate or galvanized sheets which depend on frequent painting to insure long life.

Don't forget to order LEADCLAD nails and Lead washers.

We pay freight on 15 sheets or more. Prices per sheet below.

Leadclad	Width Covered	Gauge	Length of Sheets in Feet								Weight per 100 Sq. Ft.
			5'	6'	7'	8'	9'	10'	11'	12'

Wood Sticks 50c per 100 lineal feet. Sticks can be used in all crimps where nailing is done. Allow 50 lineal feet per square for 2V-Crimp, and 100 lineal feet per square for 3 and 5V-crimp sheets.

LEADCLAD Roofing Nails 15c per lb. (Allow one lb. for 100 sq. ft.)

Lead Washers 25c per lb. (Allow $\frac{1}{4}$ lb. for 100 sq. ft.)

LEADCLAD Roll Roofing, Valley and Gutters

Standing Seam

Flat Seam

STANDING SEAM ROOFING

Each roll lays one square on the roof if applied with a 1-inch seam, made by turning a 1-inch edge on one side, and a 1½-inch edge on the other. No nails are driven through the sheets, only through the base of cleats not exposed to the weather. Each roll is made of 5 sheets forming one continuous strip with 4 double-locked cross seams.

FLAT SEAM ROOFING

Each roll of Roofing lays 100 sq. feet after seaming and locking.

Used frequently for flat decks, like porch roofs, etc. Professional roofers for this purpose use 20" x 28" small sheets, (box plate) locking same together on all four sides. To save labor in laying we furnish these "box plates" already made into long continuous sheets by lock cross seams. This eliminates two seams, which you would have to make if you used 20" and 28" box plate.

This style for valley and gutter is much preferable to long seamless sheets, as seams serve to take up expansion and contraction, and thus keeps the metal from working loose.

IMPORTANT

LEADCLAD needs no painting to keep it from rusting. It weathers to a fine slate grey. Saves its small extra first cost many times over by its longer life and saving of paint, year after year. Use LEADCLAD 29 or 28 gauge where you would use 27 and 26 gauge in tinplate. It's the thickness and quality of the coating that makes the sheet last, nothing else.

ROOFING TOOLS

If you want to borrow tools for laying, standing or flat seam roofing, state so when ordering and send \$25.00 for deposit. When returning tools to us, always mark on *shipping card* your name and address, and we will return your \$25.00.

CORRUGATED END WALL
FLASHING

Made of 12" Girth in 120" Lengths. 8" Corrugated Face—4" "plain back." Made to fit either 2½" or 1¼" Corrugations. 2½" has three Corrugations. 1¼" has six Corrugations.

Made of 12" Girth in 28" Lengths. 8" Corrugated Face—4" plain back. Made to fit either 2½" or 1¼" Corrugations.

These flashings save a lot of labor and make a neat looking, waterproof job.

Nails and Washers

LEADCLAD Roofing will give at least double the service of galvanized or terne products. Stop and think! If LEADCLAD is fastened in place with galvanized nails, what happens? The nails rust; the roofing gets loose, rattles and leaks, all due to having "saved" a few cents originally.

Use LEADCLAD nails and lead washers and avoid this expense and trouble. For corrugated and V-Crimps use 1¾ or 2 in. nails; for brick or stone siding or roll roofing use 1 or 1¼ in. nails. About one pound of long nails or three-fourths of a pound short ones are needed for a square.

Lead Washers are the cheapest form of insurance against leakage. They act as sealers, just as rubber rings on fruit jars. One-third to one-half pound needed for a square. Price, 15c lb. Lead washers, 25c.

6"	All Slip Joints....	2.10	2.60	.24	.49	.56	.78	.94

"S. B." stands for Single Bead. "D. B." stands for Double Bead.

Eaves Trough comes in 10 foot lengths. It requires no solder and no experience is necessary to put up LEADCLAD Slip Joint Eaves Trough.

When ordering Single Bead Eaves Trough, be sure to state the quantity of Right Hand and Left Hand required.

Double Bead LEADCLAD Eaves Trough is stronger and can be used either Right or Left Hand as desired.

How to Tell the Hand of Eaves Trough

Stand facing the building—if the water runs to your right to reach the Conductor, you want Right Hand; if to your left you want Left Hand.

Miters must be definitely specified. That is:

Inside Corner—Right Hand or Left Hand.

Outside Corner—Right Hand or Left Hand.

We pay freight on 100 ft. or more of LEADCLAD Eaves Trough, or on less quantity when ordered with other material that take the prepaid rate.

Selecting the Proper Roof

IT is important from the standpoint of economy and service that the proper roof be selected for your purpose. This is determined to a large extent by the pitch as well as the use to which the building is to be put. If you will send us the information in the box below we would be glad to advise you on the best roof for your building.

The best roof for general farm purposes is 5 V-Crimp. This type of roof is easily and quickly installed, a hammer being the only tool necessary. It is doubly protected against the weather and the center seam gives added strength and rigidity, so that the wider spacing of studs is possible. It makes an absolutely leakproof and stormtight roof which combines utility with beauty. The manner of applying 5 V-Crimp and its protective features are shown below.

NOTE CAREFULLY—IMPORTANT

1. Send us the length of your rafters from the ridge to the eaves.
2. Give us the complete length of your ridge including the projection over both gables.
3. Give us the height in feet and inches from the square of your building to the ridge.
4. State the use to which your building is to be put.
5. If valleys occur give the length of each one separately.

Immediately upon receipt of this information we will advise you concerning the best form of roofing material to be used for your building and its cost.

A hammer is the only tool necessary to lay 5 V-Crimp roofing.

TESTIMONIALS

Read What Users Say!

Cleveland, Ohio.
March 10, 1927.

Gentlemen:

We have your letter of the 9th, and in answer wish to state that we have had Leadclad on one of our buildings for many years, exposed to the most undesirable conditions, and it has withstood both weather and inside conditions, without even a coat of paint, and it is still good. We think it is the best thing of its kind at anywhere near the price.

The writer thinks so much of it that he has used it on his new home.

We do not hesitate to recommend it.

Very truly yours,
Geo. J. Feiss
Superior Foundry Co.
Cleveland, Ohio

Newark, N. J.
April 11, 1922.

Edward F. Maher, Inc.,
Woolworth Building,
New York City.

Gentlemen:

Yesterday while making an inspection of a shingle roof at Monmouth Beach we found the Leadclad shingles with which we covered the roof, still intact.

It gives us pleasure to advise you that this material is holding up even better than we anticipated. At the time we purchased it, you will recall that we advised you that this cottage was facing the ocean and that it would naturally be subject to the salt water atmosphere. The Leadclad has now been on the roof for a year and a half and we have never painted it. We do not find a blemish on it altho in the vicinity, galvanized sheets have previously rusted out in the same period of time.

You may be sure that in the future when we have any of this work to do, we will be more than pleased to use Leadclad.

Yours very truly,
Schwing & Henely
George Schwing.

Wheeling, W. Va.
June 9, 1927

Mr. A. R. McLaren, Engineer,
Hearst Bldg.,
San Francisco, Cal.

Dear Sir:

In reply to your letter of June 3rd, wish to advise that the latter part of 1922 we erected our new plant. One-half of this plant, the roof was put on with Leadclad sheet iron and the other half of the plant, the roof was of ordinary galvanizing sheet iron.

The galvanized roof was painted both sides before being put on and then the outside given another coat of paint after iron roof was put in place. The Leadclad sheet iron roof was put on without any paint and has not been painted since it was erected, while the galvanized roof has had to have a coat of paint every year.

Before writing this letter the writer made a personal inspection of this Leadclad roof and it appears to the writer to be in first class condition and will need no painting or attention for years to come.

If you should desire any further information, feel free to call upon us.

Yours very truly,
Wheeling Bronze Casting Co.
W. J. Braddock

WJB:B

Barnesville, Pa.
May 1, 1928

Leadclad Wire Co.,
Monkstown, W. Va.

Gentlemen:

Your 1928 catalog is certainly a revelation. I have often wondered why it was that I have some old wire here which my father bought 45 years ago and some of it is still good. And why galvanized wire of the ordinary kind procurable today would not last more than two or three years at the most. And have often asked the question when fence was under discussion.

One man, a preacher, stated that the process of manufacturing durable wire fence had been lost and that manufacturers had spent thousands of dollars in experiments but up to that time had not succeeded in re-discovering the old or a better new process. This discussion was held probably 10 years ago when we were contemplating the purchase of a good fence to enclose a cemetery.

I believe you have discovered the new and better process, as the barbed wire I bought from you about 2 years ago is as good as ever in spite of the fact that some of it is within 20 feet of a double track railroad where traffic is very heavy and the effects of sulphur and soft coal smoke destroys ordinary galvanized wire in two years time.

I am enclosing herewith an order for Leadclad barbed wire, some fence posts, and rock faced siding.

(Signed)
Respectfully yours,
J. H. Keilman.
Barnesville, Pa.

How to Order LEADCLAD Roofing Gutters, Spouting, Eaves Trough, Etc.

FIRST. Figure area of roofing required.

SECOND. Be sure to state how much left hand and how much right hand Eaves Trough you need.

THIRD. Make a list of fittings for Eaves Troughs, such as Miters, Hangers, End Caps and Outlets. These should be exactly the same size as the Eaves Trough.

FOURTH. State how much Conductor Pipe you will need and be sure to order the proper size to fit the Eaves Trough. *Conductor Pipe is always smaller than the Eaves Trough.* For instance, 3-inch Conductor Pipe should be used with 5-inch Eaves Trough; 2-inch with 4-inch Trough; 4-inch with 6-inch Trough.

FIFTH. Make a list of fittings which go with Conductor Pipe, such as Elbows, Conductor Hooks, Strainers, Funnels and Cut-offs. These should be ordered exactly the same size as Conductor Pipe.

LEADCLAD Slip-Joint Eaves Trough Requires No Solder

Lead, when exposed to the elements, takes on a protective film that must be removed by the soldering flux. A cut acid flux with a bit of salammoniack in it does the trick. Remember it takes more heat to melt and amalgamate the *heavy coating* on LEADCLAD; and "more heat" in this respect means a slower movement of the soldering iron, and *not* a hotter iron.

LEADCLAD Eaves Trough Hangers

6 Inch.....	.62 Dozen	.66 Dozen

Eaves trough hangers come in a variety of styles of "shanks," with holes punched for insertion of "circle" at proper height to allow for adjustment or slope of trough to give good drainage. The shank and circle hangers are much more permanent and satisfactory than wire hangers. The shanks generally used are Nos. 6, 7, 8, 9, 10, 11 or 12. No. 6 is made to nail against O. G. moulding. No. 7 is made to drive from 3" to 4" square into cornice. No. 8 is for driving from 4" to 6" into cornice when shingles project far beyond cornice. No. 9 is to drive with the pitch of the roof. No. 10 is for nailing against square box cornices. No. 11 is for nailing to side of exposed rafters.

Dear Sir:

We want you to get all the Leadclad fence and roofing business in your neighborhood. To make this easy, we are sending a handy resale catalog with a big discount on Leadclad products.

For your low Dealer's cost we enclose Dealer's Price List No. 14 on Leadclad fencing and Dealer's illustrated Price List No. 336 on Leadclad roofings.

Use the Leadclad catalog to help you in your resale work and use the wholesale lists as your purchasing guide. This will make it easy for you to select all your needs in farm, poultry and lawn fence, barbed wire, posts, gates, Leadclad roofing, pipe, trough, etc., from the handy illustrated catalog and make a better profit on each sale.

You not only make more money, but Leadclad builds good will and confidence for your firm, marking your store as a place where high quality goods can be had.

NEIGHBOR DAVE SAYS-

"To all th' folks:-

I'm goin'
t' talk to you from Radio
Station KDKA every Wednesday
evening about quarter past five
o'clock, startin' January 21st,
an' I hope t' feel that you're
all there with me.
Reckon th' evenin' chores will be done
by that time, an' it's too early for prayer
meetin', so you ought t' be listenin' in.
Goin' t' talk about "Just Neighbors",
"Keepin' Busy", "Th' Party Line", an' a few
other things."
Yours for long life,
NEIGHBOR DAVE
at th' LEADCLAD WIRE CO.,
MOUNDSVILLE, W. VA.

LEADCLAD FENCES LAST.

Additional catalogs, samples,
circulars and helps will be
furnished freely. Write for
them.

Most truly yours,

LEADCLAD WIRE COMPANY

Leadclad Walk Gate Irons for Pens and Runways.....	4.00 set

Complete set for SELF CLOSING gate consists of 2 uprights 4' 7"; 1 each of gate head and gate sill, 3' 3"; 4 gusset corner braces and bolts for assembling; 1 each frame head and frame sill 3' 3" long, to tie together 2 Leadclad Tee posts, making a complete gate frame any height desired. Gate is hung either right or left, and automatically closes. All angle irons are 1¼" and punched for attaching netting to frame in line of fence.

In Leadclad Poultry and Fur Farm Netting, the heavy jacket of pure lead is applied after weaving which seals thoroughly, gives great firmness and eliminates any crevice that might hold moisture and cause rust.

Leadclad netting is much heavier in actual weight than ordinary netting, all wires will gauge over size. This is due to the heavy lead jacket that assures long life, eliminates replacement and upkeep expense.

Leadclad Netting is used for Poultry, Foxes, Muskrats and all Fur bearing animals, Game Preserves, Flying Cages, Dog Kennels, Tennis Courts, Window Guards, Flowers and Vine Trellis.

There is but one leadclad fence made
and that is made by the Leadclad Wire
Company
